The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. Anti-PRO antibodies are useful for the affinity purification of PRO from recombinant cell culture or natural sources.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human nucleic acids encoding secreted and transmembrane polypeptides, designated as PRO polypeptides, useful as pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      KKIPSGLPELKYLQIIFLHSNSIARVGVNDFCPTVPKMKKSLYSAISLFNNPVKYWEMQP 360

Claim 12; Fig 328; 813pp; English.

```
PRO polypeptides. The PRO polypeptides are useful to detect other. PRO polypeptides, to link bioactive molecules to cells expressing PRO polypeptides, to modulate biological activities of cells expressing PRO polypeptides, and to detect the presence of mammalian lung, colon, breast, prostate, rectal, cervical or liver tumours by comparing PRO polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TMF-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation of chondrocytes, the proliferation of artilage, the proliferation of a cytokine from peripheral blood of T-lymphocytes, the release of a cytokine from peripheral blood the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polynucleotides encoding PRO polypeptides can be used to generate probes, antisense RNA/DNA, transgenic or knock out animals and can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó

ABB85003. The PRO proteins and polynucleotides have cardiant, cytostatic, antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polynucleotides, proteins, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO polynucleotides have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABL08259 to ABL88267 represent primers and probes used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gurney AL, Hillan KJ, Marsters SA, Pan J, Paoni NF; Watanabe CK, Williams PM, Wood WI, Ye W;

                                                                            transmembrane proteins used therapeutically. The PRO proteins have eyrostatic, anti-inflammatory, anti-proliferative and immunosuppressive activity. The proteins and polynucleotides can be used in therapy, identification of homologues, raising antibodies and design of probes and primars. They can be used in a range of diseases related to proteins that they have homology with, e.g. a PRO protein having homology to complement proteins may be used in inflammatory responses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mouse; cytostatic; antiinflammatory; immunoregulatory; tissue integrity; wound healing; immune response; vaccine; asthma; allergy; cell trafficking; BGN; bone/cartilage proteoglycan I protein; biglycan; PG-S1; secreted protein; therapy.

XX Novel isolated polypeptide useful to isolate corresponding interacting proteins or other compounds, to quantitatively determine levels of interacting proteins or other compounds, and as therapeutic target.

PT proteins or other compounds, and as therapeutic target.

XX Claim 6; Page 76-77; 101pp; English.

XX The patent discloses novel polynucleotides and their corresponding proteins which play a major role in induction of growth, cell migration cell claim and proliferation, cell-cell interaction and the differentiation of tissue-specific cells. These proteins are important in the maintenance of tissue integrity and thus are important in the maintenance consecution sasays to determine the biological activity, to raise multibodies, to isolate corresponding interacting proteins or there compounds, and as therapeutic target in a whole angling of disease corresponding interacting proteins or other compounds, to quantitatively determine levels of interacting proteins or other compounds, and as therapeutic target in a whole range of disease corresponding interacting proteins or other compounds, to age and physical mapping, in positional cloning of disease to tag or identify an organism or its reproductive material (as non-disruptive tags for marking organism or its reproductive material (as non-disruptive tags for marking organisms), and for the diagnosis and correspondent of a vaccine or anti-cancer treatment, as target for cancer treatment, as immunorequiatory and anti-inflammatory molecule, as a part of a vaccine or anti-cancer treatment, as target for cancer treatment, and as a target for anometure of diseases such as a starget for anometure of diseases such as a starget for anometure of diseases such as a starget for anometure the activity of the soluble molecule that binds protein from mouse. BGN is also known as bidlycan or PG-SI.

The present sequence is bone/cartilag

isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation healing and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides the protein and coding sequences of cDNAs

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic
                                                                                                                                                                                                                                                                           Human, nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosls; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   á

polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as
                                                                                                                                                                                                           a food supplement. [11] and its binding partners are useful in medical imaging of sites expressing [II]. [I) and [II] are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                        Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 56 FPTREPRSHFFPFDLFPMCPFGCQCYSRVVHCSDLGLTSVPTNIPFDTRMLDLQNNKIKE 115

The present invention describes primer sets for synthasising Soul (2011) length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary trand of a polymucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polymucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polymucleotide which comprises a 3'-end sequence complementary to a polymucleotide which comprises a 3'-end sequence complementary to a polymucleotide which comprises a 3'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in gene therapy. The primers are useful for synthesising polymucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the control and/or diagnosis of the abnormality of the full-length cDNAs. The primers are also useful for the control and/or diagnosis of the abnormality of the full-length cDNAs easily without any specialised methods. AAH03165 to AAH13628 and AAH13633 to AAH13633 to AAH13632 to AAH13632 represent human anino acid sequences; and AAH13629 to AAH13632 represent human anino acid sequences; and the exemplification

Recombinant biglycan, obtd. by expression of encoding cDNA (AAT08768) in eukaryotic host cells, can be used to enhance the survival and maintain the structure and function of CNS neurons during normal ageing as well as after pathological and/or traumatic nervous system damage. It can also be used to restore function following nervous system lesions and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               60 -----FSAMCPFGCHCHLRVVQCSDLGLKTVPKEISPDTTLLDLQNNDISELRKD 109

The invention relates to stabilizing dystrophin-associated protein complexes (DAPCs) on the surface of a cell or activating a postsynaptic membrane of a cell that comprises contacting the cell with an effective amount of biglycan. A composition comprising biglycan or its portion DAPC in cells, characterized by breakdown of muscle cell membrane, phore in cells, characterized by breakdown of muscle cell membrane, which includes muscular dystrophies, such as Duchenne's, Becker's, Congenital, Limb-girdle muscular dystrophy and mytonic dystrophy and a condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Dystrophin-associated protein complex; DAPC; postsynaptic membrane; biglycan; muscular dystrophy; neuromuscular; neurological; smooth muscle; nootropic; neuroleptic; antiviral.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               characterized by abnormal neuromuscular junction or synapse, such as enteromuscular or neurological diseases in a subject. Neurological diseases in a subject. Neurological diseases, include polymyositis and Alzheimer's disease. Biglycan is also useful for preventing and treating smooth muscle disorders, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cardiac myopathies and for treating and inhibiting infections of cells by microorganisms e.g. viruses. Agents that modulate the activity of DAG-125, identified by the methods are useful in the prophylactic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    postsynaptic membrane of a cell for treating or preventing muscular, neuromuscular and neurological disorders, involves contacting cell with

Human biglycan (AAR87952) is a chondroitin sulphate proteoglycan with neutrotrophic activity for brain neutrons. It can be used to enhance the survival and maintain the structure and function of CNS neurons during normal ageing as well as after pathological and/or traumatic nervous system damage. It can also be used to restore function following nervous system lesions and degenerative diseases, and to improve learning efficiency and memory in the elderly and in patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              241

The invention relates to the inhibition of transforming growth factor-beta (TGF-beta) activity involving contacting TGF-beta with a purified polypeptide comprising laucine-rich amino acid sequence of a member of decorin superfamily of mammelian proteoglycans. The following activities can be attributed to the polypeptide of the invention: cytostatic, nephrotropic, antirheumatic, antirarthritic, vasorropic, antiarteriosclerotic, hepatotropic, cardiant, dermatological and valnerary. Polypeptides of the invention act as transforming growth factor-beta (TGF-beta) binder. The polypeptides of the invention can be used for treating a pathology, particularly proliferative pathology caused by a transforming growth factor-beta (TGF-beta) regulated activity such as cancer; particularly fibrotic cancer, fibrotic activity such as cancer; particularly fibrotic activity such as cancer; particularly fibrotic adult respiratory distress syndrome, cirrhosis of liver, fibrosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          other invasive skin injuries and reconstructive surgery. The wounds treated with the polypeptide, particularly decorin exhibit no detectable scarring, and are histologically normal. The current sequence represents

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     neurotrophic activity for brain neurons. It can be used to enhance the survival and maintain the structure and function of CNS neurons during normal ageing as well as after pathological and/or traumatic nervous system damage. It can also be used to restore function following nervous system lesions and degenerative diseases, and to improve learning efficiency and memory in the elderly and in patients

```
The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                             Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Wang D;

in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as Albehmer's, Parkinson's disease, Huntingfon's disease, amportrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, and thrombolytic activity, chemotactic/chemokinetic activity, hemotactic/chemokinetic activity, haemostatic and thrombolytic activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Neglected target tissue antigen; NTTA; autoimmunity; autoimmune response;

tissue antigens NTTAs are antigens (whole antigens or fragments)

tissue antigens NTTAs. NTTAs are antigens (whole antigens or fragments)

to tinvolved in autoimmunity. These peptides and proteins are used in the invention which involves and mistering an NTTA as an antigen based immunotherapeutic agent, to a host affilicted with an autoimmune disease. The recommenderapeutic agent is used to treat autoimmune diseases such as insulin dependent diabetes mellitus, multiple sclerosis, autoimmune thyroiditis, uveoretinitis, rheumatoid arthritis or abnormal confinamentory inmune responses. The NTTA induces requisitory the NTTA but on participating in the immune response. The NTTA are capable of recognition by substantial populations of uncommitted T cells which can be primed, or biased, towards requisiting undesirable immune tesponses even when target determinants used as agents promoting tolerance agents have failed to induce an effective regulatory T cell response. NTTAs as agents promoting tolerance are anticipated to be safer than use of target determinants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               298

factor-beta (TGF-beta) activity involving contacting TGF-beta with a purified polypeptide comprising leucine-rich amino acid sequence of a member of decorin superfamily of mammalian proteoglydans. The following activities can be attributed to the polypeptide of the invention:

Cytostatic, nephrotropic, antirheumatic, antiarthritic, vasotropic, antiarteriosclevotic, hepatotropic, cardiant, dermatological and vulnerary. Polypeptides of the invention act as transforming growth factor-beta (TGF-beta) binder. The polypeptides of the invention can be caused by a transforming growth factor-beta (TGF-beta) regulated activity such as cancer, particularly fibrotic cancer, fibrotic activity such as cancer, particularly fibrotic cancer, fibrotic disease, glomerulonephritis, rheumatoid atthritis, arteriosclerosis, adult respiratory distress syndrome, cirhosis of liver, fibrosis of lungs, post-myocardial infarction, cardiac fibrosis, post-angioplasty restensis, renal interstitial fibrosis and certain dermal fibrotic conditions such as Keloids and scarring resulting ferm burn injuries; other invasive skin injuries and scarring resulting from burn injuries; chemical with the polypeptide, particularly decorin exhibit no detectable scarring, and are histologically normal. The current sequence represents human decorin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               4;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Use of decorin or biglycan polypeptide for inhibiting TGF-beta activity in the treatment of dermal wounds and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180 NKVKKIQKDTFKGMNALHVLEMSANPLDNNGIEPGAFEGV-TVFHIRIAEAKLTSVPKGL 238

Claim 9; SEQ ID No 804; 837pp; English.

New isolated nucleic acid encoding a protein for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives -

The invention describes an isolated nucleic acid molecule (I) encoding a novel central nervous system protein. (I) and polypeptides (III) encoded CC by (I), are used to treat a medical conditions and in diagnosis of a pathological condition. Disorders which are diagnosed or treated include cutoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders c.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. Alzheimer's disease and anglogenesis, nervous system disorders e.g. Alzheimer's disease and amylotrophic lateral sclerosis, infections caused by bacteria, viruses c.g. captured immunodeficiency virus (AIDS) and fungi, ocular disorders c.g. corneal infection, gastrointestinal disorders e.g. dysphagia.

CC agonocarcinomas and irritable bowel syndrome, reproductive system adenocarcinomas and irritable bowel syndrome, reproductive system of storders e.g. testicular femilisation, endocrine disorders e.g. diabetes and pituitary dwarfism, cancers and disorders at the cellular level e.g. leukaemia, disorders e.g. nonallergic rhinitis, renal disorders e.g. crepitatory disorders e.g. nonallergic rhinitis, renal disorders e.g. caute kidney failure and blood related disorders e.g. myocardial coult fartion. The polypeptides can also be used to aid wound healing and epitual relations before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein,

                  is a proteoglycan having a 40 kba core profein. Recombinant decorin can be produced by cotransfection of CHO-DG44 cells with pSV2-decorin and pSV2dhfr. Large-scale cultures can be performed using CHO cells attached to microcarrier beads. The recombinant protein is purified from the cells using a 3-step chromatographic guanidinium ions (ppm range), partic. in protein-confg. solins. purified using GHC1, and also has therapeutic applies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PKSLAELRIHENKVKKIQKDTFKGMNALHVLEMSANPLDNNGIEPGAFEGV-TVFHIRIA

The resulting fusion proteins were useful for inhibiting the activity of a cell regulatory factor, esp. IGF-beta, and hence for treating conditions associated with over-activity of the growth factor such

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                human colfagen I(a) linked, compressed in Escherichia coli transformants decorin). It can be expressed in Escherichia coli transformants carrying a vector incorporating a chimeric gene (AAT16517) coding fit the fusion. The decorin binds to type I collagen and thus affects Elbril formation. It inhibits the cell attachment-promoting activity of collagen and fibrinogen by binding to such molecules near their cell binding sites. The collagen moiety provides an integral substratum or scaffolding for the decorin. The fusion protein acts to reduce scarring of healing tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chimaeric DNA encoding protein contg. extracellular matrix protein domain - and cellular regulatory factor domain, partic. useful as osteogenic agents, also related vectors, transformed cells and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    110 NNKIKEIKENDFKGLTSLYGLILNNNKLTKIHPKAFLTTKKLRRLYLSHNQLSEIPLNLP

The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino
                                                                                                Amino acid sequence of a chimeric collagen 1 (alphal)/decorin protein.

                                                                                                                                                  incorporate trans-4 hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinospen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of polypeptides which do not normally contrain trans-4-hydroxyproline. The present sequence represents a chimneric collagen I (alphal)/decorin protein, which may be produced using the method of the invention.
acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and

stem cell proliferation, haematopoiesis, nerve tissue regeneration;
immune suppression, immune stimulation, anti-inflammatory, leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     were generated by PCR and fused to Maltose Binding Protein. The resulting fusion proteins were useful for inhibiting the activity of a cell regulatory factor, esp. TGF-beta, and hence for treating conditions associated with over-activity of the growth factor such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Active fragments of decorin (full-length coding sequence AAQ50046)
                                                                                                                                                                                                                                             fragments of protein esp. decorin - with cell regulatory domain, useful for inhibiting cell regulatory factor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              14;
                                                                                                                                                                                                                                      polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically the proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to
                                                                                                                                                                                                                                                                                                                                                                                       increase stem cell proliferation; to regulate haematopolesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU39510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                          Nucleic acids encoding a range of hu\mathrm{man} polypeptides, useful in genetic vaccination, testing and therapy ^{\text{-}}

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Active fragments of decorin (full-length coding sequence AAQ50046) were generated by PCR and fused to Maltose Binding Protein. The resulting fusion proteins were useful for inhibiting the activity of a cell regulatory factor. esp. GPF-beta, and hence for treating conditions associated with over-activity of the growth factor such

(HUMA-) HUMAN GENOME SCI INC

Barash SC, Ruben SM; Rosen CA,

WPI; 2001-451931/48. N-PSDB; AAS33113 New nucleic acids and polypeptides, useful for diagnosing, preventing or treating medical conditions -

Claim 11; SEQ ID No 396; 753pp; English.

The INVELLOR TELATES to novel 1801ated nucleic acid molecules (1) and coling human secreted proteins (11). (1) and (11) are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, agoats, cats, dags, chickens or sheep. (1) and (11) may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate expression of secreted proteins. (1) and complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (FCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples, and so which patients may the production of antibodies and in assays to identify modulators and the production of antibodies and natagonists may also be used to down requiate expression and activity of the secreted proteins. The anti-(11) antibodies and antagonists may also be used to down requiate expression and activity of (11). The anti-(11) antibodies and antagonists may also be used as diagnostic agents for (11). The anti-(11) antibodies of an ununosorbant assay (EIISA). The disorders include for example: immune/autorimmune diseases (e.g. HIV) (human immunodeficiency virus) infections, anaemia, rheumatorid arthritis and multiple sclerosis), cancers and hyperproliferative disorders (e.g. parkinson's disease), neurological diseases (e.g. Alzheimer's disease, cerebrovascular disorders (e.g. cardiac arrest, tachycardia, viruses and charcot-Marie-Tooth disease), cardio-/candiar disorders (e.g. cardiac arrest, tachycardia, and and antibodies can also be used to promote wound healing, maintain organs before transplantation, and support cell culture of primary tissues. AAUJ0342-AAUZ066 repersent human servet arrest or primary experience of primary contract and antibodies can also be used to promote voreice of primary tissues. of primary tissues. AAU20342-AAU20666 represent human secreted protein amino acid sequences, and related sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification but was obtained in electronic format directly from WIPO invention relates to novel isolated nucleic acid molecules (I) at: ftp.wipo.int/pub/published\_pct\_sequences.

The resulting fusion proteins were useful for inhibiting the activity of a cell regulatory factor. esp. IGF-beta, and hence for treating conditions associated with over-activity of the growth factor such

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs different total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed CDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAZ42265 to AAZ43075 represent novel 5' expressed sequence tag (EST) sequences, corresponding to human secreted proteins. AAY64651 to AAAY63438 represent the EST-related proteins corresponding to AAZ42265 to AAZ43052. The 5' ESTs can be used for producing secreted human gene products. They can be used to identify and isolate 5' untranslated regions (UTRS) and upstream regulatory regions which control the location, development stage, rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals, or in diagnostic procedures to identify individuals having genetic diseases resulting from abnormal gene expression. The products may also be used in gene therapy protocols. The nucleic acids encoding signal peptides can be used in the action of a polymentide can be used in the products and peptides can be used as the content of the products and peptides can be used and the content of the products and peptides can be used in the product of the products and peptides can be used in the product of the product
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diagnostic, forensic, gene therapy, and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               secreted proteins is

Secreted proteins have therapeutic value, and the identification of new secreted proteins valuable. AAZ42249 to AAZ4226 and AAY64644 to AAY64650 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               24.7%; Score 493; DB 21; Length 88; 100.0%; Pred. This invention describes novel nucleic acid sequences that are highly expressed in normal ovary tissue. Artificial chromosomes and cosmid clones containing the sequences can be used as gene transfer vehicles. The sequences can be used to produce DNA fragments containing full-length genes. Host cells transformed with the sequences can be used to produce polypeptides transformed with the sequences can be used to screen phage displays for polypeptide fragments, which can be used to screen phage displays for polypeptides that bind to them, or as tools for identifying agents active against ovarian cancer, or to prepare medicaments for treating ovarian cancer. The cDNA sequences can be used to obtain genomic genes, their promoters, enhancers, silencers, exon structures, intron structures and their splice variants. AAY59724-Y59837 represent protein fragments encoded by the cDNA sequences represented in AAX41222-Z41324 which are derived from normal human ovarian tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             239 PPTLLELHLDYNKISTVELEDFKRYKELQRLGLGNNKITDIENGSLANIPRVREIHLENN 298

The resulting fusion proteins were useful for inhibiting the activity of a cell regulatory factor. esp. TGF-beta, and hence for treating conditions associated with over-activity of the growth factor such

in AAA43398 to AAA4239. The proteins can have activities based on the tissues and calls the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antitherary; immunomodulator; antidiabetic; antibacterial; antibacterial; antibacterial; antibacterial; antibacterial; neuroprotective; cardiant; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic and antiangiogenic. The polymucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polymucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoletic cells, autoimmune cells, to treat disorders of haematopoletic cells, autoimmune rejection, modulate haemostatic or thrombolytic activity, modulate namostatic or thrombolytic activity, modulate calcinous. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAA44240 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ij

The genes (AA290631-633) and the proteins (AAX67598-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | : | : | : | : | : | : | 3 | SLSYRTISCINAMLTQIPPITAPQITSLEJGNSIASIPDEAFNGLPNLERLDLSKNNIT 380

in ABB4338 to AAB44239. The proteins cancer associated proteins given tissues and cells the genes are expressed in. Example of activities based on the tissues and cells the genes are expressed in. Example of activities conclude cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antibarterial; antiviral; antinflammatory; antiphyroid; antialleragic; antibarterial; antiviral; antinflammatory; antiphyroid; antialleragic; antibarterial; antiviral; cartinflammatory; antiphyroid; antialleragic; antibarterial; antiviral; coording and polypeptides can be used for preventing, treating or molynelocides, polypeptides and diagnosing pathological conditions. Polynucleotides, polypeptides and diagnosists and antagonists from the present invention may be used to treat immune disorders by activating immune cells, to treat disorders of haematopolatic cells, autoimmune cells, to treat disorders of haematopolatic cells, autoimmune cellscrib, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and cancers and cancers, cardiovascular disorders, neurological disease and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAB44240 represent sequences used in the exemplification of

```

```
The invention relates to an isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tumnour endothelial marker (TEM) protein selected from ABB90732, ABB90749, ABB90750 and ABB90769. The antibodies which bind to TEM proteins have cytostatic, immunostimulant and antianglogenic activity. They are useful for inhibiting tumour growth, necanglogenesis in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; mouse; rat; TEM; tumour endothelial marker; NEM; PEM; cytostatic normal endothelial marker; pan-endothelial marker; immunostimulant; antiangiogenic; tumour; neoangiogenesis; vascularised tumour; neoangiogenesis; vascularised tumour; polycystic kidney disease; diabetes; retinopathy; rheumatoid arthritis;

the proteins are collectively known as colon cancer associated nucleic acid molecules (N) and proteins. The colon cancer antigens have expostatic activity and cancer antigens. The colon cancer antigens have expostatic activity and cancer antigens. The colon cancer associated with inappropriate P capterssion. For example, N and P may be used to treat disorders cassociated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. additionally, N may be used to produce the colon cancer associated Ps. by inserting the nucleic acids into a host cell and culturing the cell to the activity of patients of the presention. Additionally, and production of the colon cancer associated Ps. and treatment of colorectal carcinomas and cancers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          anglogenic disorders (claimed), specifically cardiac hypertrophy (especially where associated with elevated levels of prostaglandin F2 alpha or induced by myocardial infarction), trauma (wounds, burns, or tissue regeneration more generally, including neurological disease), and cancer. Antagonists may be used similarly, also to treat age-related macular degeneration (or other anglogenic retinal disorders) and to prevent excessive growth of connective tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 28 DEDYDQEPDDDYQTGFPFRQNVDYGVPFHQYTLGCVSECFCPTNFPSSMYCDNRKLKTIP 87

treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, selected from systemic lupus erythematosus, rheumatoid arthritis, systemic selected from carthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sjogrem's systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems, hepatobiliary diseases, inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune or immune-mediated skin diseases, allegic diseases, inflammatory bowel diseases including graft rejection and graft-versus-host-disease. AACS878 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AACS879 to AACS878 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

angiogenic disorders in mammals (e.g. atherosolerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB24388 to AAB24435 represent nucleotide and protein sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                    Gerber H, Hillan KJ, Goddard A;

```
(vitellogenic carboxypeptidase homologue) polypeptide, or an agonist or antagonist of these. Also included in the invention is a method for preparing the composition, agonists and antagonists of PRO230, PRO216 or PRO302, and antibodies that bind to a PRO330, PRO316 or PRO302, polypeptides. The composition of the invention has cardiant, angiogenic, cytostatic, ophthalmic, and antiprolliferative activity. Analysis of the preval of expression of a gene encoding a PRO230, PRO216 or PRO302 polypeptide or detecting the presence/absence of the polypeptide is useful for diagnosis of cardiovascular, endothelial or angiogenic disorders in mammals. Anti-PRO230, PRO216 or PRO302 antibodies are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      in these diagnostic methods. The PRO230, PRO216 or PRO302 polypeptides fond their coding sequences), agonists and antagonists are useful for treatment of cardiovascular, endothelial or angiogenic disorders, especially cardiac hypertrophy (especially characterized by presence of an elevated level of PGF-2alpha), trauma or cancer, myocardial infarction or age-related macular degeneration. In particular, PRO216, an agonist of PRO230, PRO216 or PRO20, an anti-PRO216 antibody is useful for inhibition of endothelial cell growth in a mammal. Endothelial cell growth can be stimulated by administration of PRO230, an anti-PRO300 agonist or an anti-PRO300 antibody and anti-PRO300 antibody. Additionally, an anti-PRO302 antibody can inhibit angiogenesis induced by PRO302 in a
                                                                                                                                Human, PR0216; Osteomodulin; fibromodulin; homologue; cardiant;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents the human PRO216 amino acid sequence. PRO216 is a human osteomodulin/fibromodulin homologue. The invention relates to a composition comprising a PRO230 (tubulointerstitial nephritis antigen homologue), PRO216 (osteomodulin/fibromodulin homologue) or PRO302
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A composition comprising PRO230, PRO216 or PRO302 polypeptides, agonists or antagonists useful for promotion or inhibition of cardiovascularisation, angiogenesis or endothelialisation in mammals
                                                                                      PRO216 (osteomodulin/fibromodulin homologue) protein sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Goddard A, Gurney AL, Hillan KJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 2; Fig 4; 135pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                               98US-0100262
                                                                                                                                                                                                                                                                                                                                                                                                                                                      98WO-US19177.
                                              (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gerritsen ME,

tumour necrosis factor-alpha (TNF-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation or differentiation of chondrocytes, the proliferation or differentiation of chondrocytes, the proliferation of inner ear utricular supporting cells of T-lymphocytes, the release of a cytokine from peripheral blood monocytes (PBMCS), or the proliferation of endothedial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adhocytes; or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polynucleotides encoding PRO polypeptides can be used to generate probes, antisense RNA/DNA, transgenic or knock out animals and can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAU12172-AAU12446 represent novel human secretory and transmembrane PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides, to link bioactive molecules to cells expressing PRO polypeptides, to modulate biological activities of cells expressing PRO polypeptides, and to detect the presence of mammalian lung, colon, breast, prostate, rectrical or liver tumours by comparing PRO polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of
                                                                                                                                                                                                                                                                                                                                                                                                                                           3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                88 -NIPMHIQQLYLQFNEIEAVTANSFINATHLKEINLSHNKIKSQKIDYGVFAKLPNLLQL 146

agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or anglogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, age-related macular degeneration rheumatoid arthritis, angina, myocardial infarction, arterial restenosis, thrombophleabitis and lymphagitis. The polypeptides, agonists and antagonists are also used in claimed methods of stimulating or inhibiting endothelial cell growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         88 -NIPMHIQQLYLQFNEIEAVTANSFINATHLKEINLSHNKIKSQKIDYGVFAKLPNLLQL 146

The present sequence is that of human PRO216, a novel protein (49 kDa, pI 5.51) that is a homologue of osteomodulin and fibromodulin. The sequence is predicted from isolated PRO216 cDNA (see ART30501). PRO216 has a probable role in control of bone matrix deposition and/or osteoblast growth. PRO216 is 1 of 3 novel PRO polypeptides of the invention. PRO230, PRO216 and PRO302 polypucleotides and polypeptides, recombinant retroviral particles, ex vivo producer cells, expression vectors, host cells, and methods of recombinant production are provided, as well as antibodies, agonists and antagonists. The polynucleotides, polypeptides,
